Last Week

- ① Affine Communication Lemma.
- ② Two ways of gluing \mathbb{A}^1 outside the origin.
- ③ DVR with a double origin, and sheaves on it.
- ④ Line bundles on \mathbb{P}^1 .

A slightly more involved scheme: \mathbb{P}^n

Let $D(x_i) := \operatorname{Spec} k[x_{0/i}, x_{1/i}, \dots, x_{n/i}] / (x_{i/i} - 1)$. If we invert one of the variables, say $x_{j/i}$, we can write an isomorphism $D(x_i)_{x_{j/i}} \cong D(x_j)_{x_{i/j}}$ given by the maps

$$\phi_{ij} : x_{k/i} \mapsto x_{k/j} / x_{i/j} \quad \& \quad \phi_{ji} : x_{k/j} \mapsto x_{k/i} / x_{j/i}$$

A classical interlude

Let k be a field. Consider $k^{n+1} \setminus (0, 0, \dots, 0)$. We define \mathbb{P}^n to be:

$$\mathbb{P}^n := \{(x_i) \mid (x_i) \simeq (y_i) \text{ if there is a } \lambda \in k^\times \text{ such that } x_i = \lambda y_i\}$$

Motivating $\mathbb{P}roj$

Consider $k[x_0, x_1, \dots, x_n]$, now thought of as a graded ring with the grading given by degrees of monomials.

$\mathbb{P}roj(k[x_0, x_1, \dots, x_n])$ is the set of those homogeneous prime ideals which do not contain the ideal (x_0, x_1, \dots, x_n) . The resulting scheme is \mathbb{P}^n .

Here's an alternative description of \mathbb{P}^1 using degree 2 hypersurfaces

Relation to our original construction of \mathbb{P}^1

Note that if you just invert x^2 and xy , then this does not give a cover \mathbb{P}^1 , since the the radical of (x^2, xy) does not contain the irrelevant ideal. Geometrically speaking, this is because inverting xy corresponds to the affine open of \mathbb{P}^1 obtained by knocking off 0 and ∞ .

More Examples

$V_+(x^2 + y^2 + z^2)$ over \mathbb{R} and \mathbb{C} .

More Examples

Blow-up of \mathbb{A}^2 at the origin.

More Examples

An example of a scheme without a closed point.

Morphisms

Definition

Let \mathcal{P} be a property of morphisms of schemes. Let $f : X \rightarrow Y$ be a morphism which satisfies \mathcal{P} . Then,

- 1 We say that \mathcal{P} is *affine-local on the target* if given any affine open cover $\{V_i\}$ of Y , $f : X \rightarrow Y$ has \mathcal{P} if and only if the restriction $f : f^{-1}(V_i) \rightarrow V_i$ has \mathcal{P} for each i .
- 2 We say that \mathcal{P} is *affine-local on the source* if given any affine open cover $\{U_i\}$ of X , $X \rightarrow Y$ has \mathcal{P} if and only if the composite $U_i \rightarrow Y$ has \mathcal{P} for each i .

Using *affine communication lemma* one can then show that it suffices to check the above statements on single affine open cover.

Something flat, something finitely presented/finite type, something finite.

Not all properties are like this. For example, separatedness, properness, quasi-compactness, etc.

Something ramified, something smooth, something singular.
